

Panzura Express is sold exclusively through Panzura channel partners, who deliver deployment, configuration, and first-line support. Compute and object storage can come from a Panzura partner or from the end customer. Panzura partners bring deep experience in their specific industries and know the design, imaging, and production applications your files come out of. For an IT team of one to three people, that means having a world-class system that runs the way you need it.

What's included in Panzura Express

Panzura Express is a fully licensed bundle, not a trial edition or a feature-limited version of something larger. Panzura Express runs the same code as the multi-site Panzura CloudFS platform deployed in global enterprises, licensed for a single site and packaged with the data services and AI layers that would otherwise be purchased separately. The three tiers differ in capacity and nothing else. Every tier offers the same capabilities, so nothing is held back for an upgrade and nothing arrives as an add-on later.

Capability	What it Delivers	Business Impact
Panzura CloudFS with high availability	The same CloudFS hybrid cloud file platform that runs in global enterprise deployments, licensed for a single site and deployed with a local HA node pair. Snapshots are immutable and can be taken as often as every 60 seconds, so data encrypted or corrupted in an attack can be rolled back to a point before it started	• Recovery measured in minutes, from snapshots that ransomware, external and internal threat actors cannot alter or delete • No proprietary hardware, Panzura Express runs on your virtual hosts and S3-compatible object storage • Deployed on premises or in Microsoft Azure, AWS, or Google Cloud for maximum flexibility and control
Panzura Data Services with AI-powered Threat Control	Powerful Panzura Data Services search, audit, and AI-powered Threat Control , included in full. Threat Control watches file behavior and alerts administrators as anomalies appear, including ransomware, data exfiltration and mass deletion. The same layer records file activity for audit and makes the entire file estate searchable — the access history and retention evidence a compliance review asks for.	• Anomalous user behavior detected before it becomes a data loss event, not after a backup window closes • Audit trails and retention evidence available without a separate compliance tool, helps meet strict regulatory and contractual security obligations • Search across every file in the CloudFS estate from a single console with easy and simplicity
Panzura Nexus AI data intelligence for Microsoft 365 Copilot	Panzura Nexus makes CloudFS file data discoverable and askable in natural language through the Microsoft 365 Copilot interface your teams already use. Permissions are enforced as they change, so a person who cannot open a file cannot reach its contents, discover it exists, or know or meaning through Copilot either.	• Years of hard-earned knowledge in project files becomes answerable without building a data pipeline, migration project, or data lake • AI access reflects the governance parameters and policies already defined in CloudFS with full, real-time permission fidelity • Delivers a path to Copilot Studio agents with no additional integration burden or separate data workflows

WHO IT'S FOR

- Mid-market customers with \$10–\$100M revenue with under 300 employees
- Customers impacted by ransomware, compliance audit, or aging NAS hardware refresh
- Architecture, engineering, and construction (AEC), procurement, and project-intensive teams
- Compliance-driven Industries including healthcare, manufacturing, financial, legal, and professional services

One authoritative data set, nothing to keep in sync.

The conventional way to get security analytics and AI out of a file share is to make copies of it — a backup target, a separate search index, an ingestion pipeline for the AI tool. Each copy is another thing to license, another thing to secure, and another thing that drifts out of date. Panzura Express keeps one authoritative, immutable copy of the data in object storage and layers everything else on top of it. Panzura Data Services and Panzura Nexus read the same file system users are working in, which is why threat detection sees live activity and Copilot answers reflect the permissions in force right now.
